

Valence

Product Value Operations & Governance Model

Public Detailed Introduction v0.6

**Design value before build. Validate value after launch.
Govern value throughout operation.**

Valence is an independent method asset within the O2V Enterprise Configuration. It helps organizations design how products and initiatives should realize economic value, establish measurement readiness, and make evidence-backed investment and lifecycle decisions after launch.

O2V Framework | Opportunity-to-Value Framework

From Signal to Impact. From Idea to Asset.

1. Why Valence

Launches, feature counts, bug fixes, and training completion do not prove that economic value has been realized. Valence moves the discussion from what was delivered to who benefited, what changed, how that change becomes money, and what should happen next.

Core principles

- Delivery output is not business outcome, and business outcome is not automatically economic value.
- Material value claims used for investment or lifecycle decisions require a measurable and monetizable path.
- Non-financial KPIs are evidence along the path, not substitutes for economic value.
- A required capability or official presence does not automatically justify the current product form.
- Governance depth follows value, cost, and risk rather than treating every product equally.

Applicable objects

- digital products, applications, and customer-facing digital assets;
- AI use cases, AI assistants, and agentic workflows;
- dashboards, data products, APIs, platforms, and shared services;
- strategic initiatives with an ongoing operating lifecycle.

2. Value Realization Chain

Valence uses Value Realization Chain to avoid confusion with Porter Value Chain. It traces the causal path from a defined audience and problem through a measurable change to evidence, financial drivers, and economic value.

Audience → Problem → Change → Evidence → Money → Decision

Full expression

**Primary Audience → Main Problem → Expected Change → Product Capability / Form
→ Evidence KPI → Monetization Logic → Planned Monetized Value → Actual
Recognized Value → Governance Decision**

The execution interface for a normal product manager or Tech BP contains only six questions:

- Who is the primary audience?
- What is their main problem?
- What behaviour or outcome should change?
- Which metric will show whether the change happened?
- How can that change become money, and what is the planned amount?
- Why is the current product form required?

Primary Audience

Total employees, account counts, or the entire consumer population are coverage figures, not automatic adoption denominators. The primary audience should identify the roles, contexts, and tasks that genuinely require the core capability.

3. Three Final Economic Outcomes

Outcome	Definition	Typical Results
Grow	Increase revenue, contribution profit, or cash inflow	Incremental orders, conversion, repeat purchase, new markets
Save	Reduce or avoid cost and resource consumption	Direct savings, avoidance, productivity, reuse
Protect	Reduce revenue loss, risk loss, or interruption loss	Revenue protection, continuity, compliance, security

Productivity, experience, decision quality, branding, time criticality, risk reduction, platform reuse, learning, and strategic capability are value mechanisms. They must connect to Grow, Save, or Protect; otherwise they remain an Unvalidated Value Hypothesis.

Planned Monetized Value

Before major investment approval, a product should define its Value Realization Chain, planned monetized value, planned cost, measurement sources, Business Value Owner, and realization timeline. It is an economic estimate supported by an explicit formula and assumptions.

Actual Recognized Value

After launch, value enters Actual Recognized Value only when evidence, calculation logic, reasonable attribution, and appropriate owner endorsement exist. A qualitative hypothesis alone is not recognized economic value.

4. Value Governance in Operation

Valence keeps two core operating metrics:

Metric	Management Question
Adoption Rate	Does the primary audience complete the core value behaviour in a real context?
Investment Efficiency	Does recognized economic value justify the current operating cost?

Planned value and cost determine which products deserve governance attention. Actual adoption, recognized value, and actual cost determine performance. Actual value must not be the scope gate, because a high-approved-value product with weak realization is exactly what governance should examine.

Typical governance actions

- Monitor;
- Promote or Improve;
- Optimize or simplify the product form;
- Consolidate or reuse;
- Keep with time-boxed justification;
- Suspend or decommission.

Repeated weak signals follow a 1-2-3 pattern: first miss is Watch, second consecutive miss triggers Focus Review, and the third triggers Lifecycle Decision Discussion. Material risks can override the normal sequence.

5. Product Need Is Not Product Form

A brand may need an official digital presence. An enterprise may need a collaboration capability. A business may need a common data service. None of these needs automatically proves that a standalone mini-program, app, dashboard, or platform is the right form.

Minimum questions

- Which capabilities or scenarios are genuinely required?
- Could a website, H5 page, existing system, shared platform, API, or process change meet the need?
- What incremental value does the current form create?
- What additional build, run, compliance, and support cost does the current form create?

Preserving a required capability does not mean preserving the current product form. Before retirement, identify reusable data, content, APIs, knowledge, workflows, and user assets.

6. Relationship With O2V, CLEAR, and AiNOVA

Method	Role
O2V	Defines the end-to-end opportunity-to-value logic.
CLEAR	Turns ambiguous signals into justified action and validation input.
AiNOVA	Operates enterprise roles, decisions, funding, and governance rhythm.
Valence	Designs and governs how products and initiatives realize economic value.

AiNOVA may call Valence in Value Hypothesis & Validation for Value Realization Design, and in Product / Initiative Value Governance for run-phase governance. CLEAR does not replace formal product-value calculation or portfolio governance.

7. Simplified Example: Official Brand Mini-Program

Primary Audience: high-intent consumers actively searching for the brand or related product information.

Main Problem: they need trusted official information and a reliable next action.

Expected Change: more high-intent users reach the official entry, complete core content, and enter an official purchase path.

Value Realization Chain: high-intent consumer → trusted official information → lower uncertainty and channel leakage → official purchase path → Grow / Protect.

Evidence KPI: official search coverage, qualified visits, core content completion, purchase-entry clicks, attributed orders, or revenue-protection evidence.

Product Form Question: why must this be a standalone mini-program rather than a website, H5 page, ecommerce brand page, or shared multi-brand platform?

Public scope and rights boundary

This document publishes only Valence positioning, principles, and high-level flow. It does not publish the full playbook, client thresholds, proprietary calculation rules, execution templates, prompt chains, client materials, or internal implementation methods.
